

# Science to assist the restoration of American chestnut to Vermont

**Paul G. Schaberg**  
**Kendra M. Gurney**  
**Gary J. Hawley**  
**John B. Shane**

# Past: American chestnut ruled!

- Major component of eastern forest
- Fast growth, large, extremely rot resistant
- High-value timber species
- Nuts valuable to wildlife/livestock/people
- Tannins used in tanning leather
- Culturally significant

# Past: Historic Range

# Past: Chestnut Blight

- Blight first identified in New York in 1904
- Fungus (*Cryphonectria parasitica*) girdling canker
- Spread quickly, functionally wiped out chestnut as overstory tree by 1950's

# Past: Restoration Attempts

- Cultural methods - tree surgery, fungicide, forest gap barriers
- Identifying natural resistance among American chestnuts
- Hypovirulence
- Breeding

# Past: Breeding Methods

- **Hybrid breeding -**
  - **American chestnut x Chinese chestnut**
- **Hybrid/backcross breeding -**
  - **American chestnut x Chinese chestnut**
  - **Offspring backcrossed with American chestnut**
  - **Intercross resistant offspring**

American chestnut

Chinese chestnut

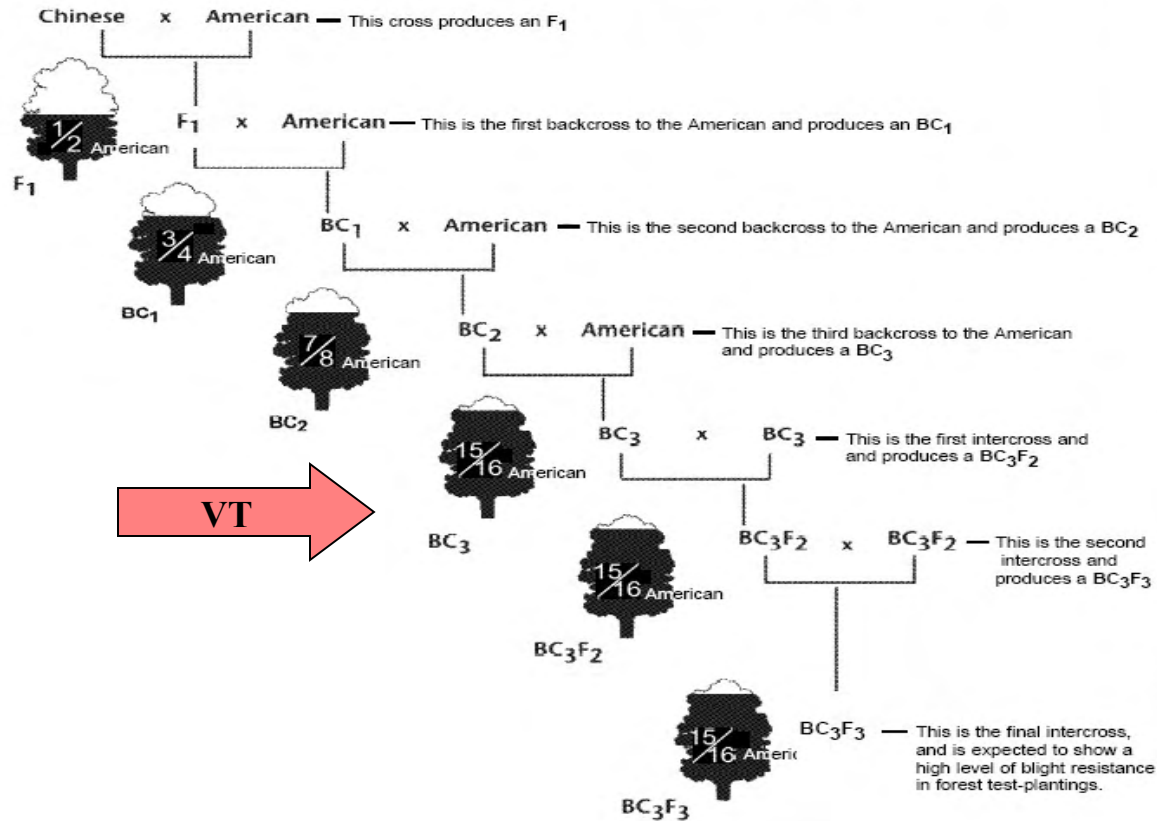

# Present: TACF Backcross Breeding

## THE AMERICAN CHESTNUT FOUNDATION'S BACKCROSS BREEDING PROGRAM

ADDITIONAL AMERICAN CHESTNUT CHARACTERISTICS ARE REGAINED WITH EACH BACKCROSS.

TACF expects a high level of blight resistance and American characteristics to be present in selected  $BC_3F_2$  seed orchard parents. Their  $BC_3F_3$  progeny will be extensively tested by TACF for blight resistance and ability to compete in the forest.

**Note:** In each step, the backcross is selected for resistance. Trees indicate average fraction of American genes with no selection.

# Present: Restoration in VT

- Tailor restoration to VT conditions
- Most breeding material from heart of range
- Very few mother trees from VT
- Genetic diversity, capture local genetics/adaptation, and potentially **augment cold hardiness**

# Present: Filling the VT Gap

- Locate new VT mother trees
  - Include in breeding program
  - Identify potential future restoration sites
- Conduct controlled pollinations in VT
- Cold tolerance trials
  - Look at American chestnut, hybrid/backcross chestnut, and native competitors

Point person: **Kendra Gurney!**

# Present: Locating Vermont Chestnut

- Contact state and private foresters, ecologists, and researchers
- Field visits
  - Location, ID, pollination potential, blight status, basic measurements
- Spatial database for future pollination and eventual restoration

# Present: Locating Vermont Chestnut

- Current inventory:
  - ~30 trees inventoried
  - ~14 sites
  - ~5 sprout sites  
(lesser priority)

# Present: Controlled Pollination

# Present: Harvest Results

## Controlled Pollination Results

Tree	Year	Hybrid/Backcross
		Nuts Harvested
Berlin, Jr	2006	127
Colchester 1	2006	38
Berlin, Sr	2007	19
Colchester 1	2007	54
Colchester 2	2007	98

Goal: 100 seedlings per source

# Present: Cold Tolerance Tests - Shoots

**Valley View Farm, Shelburne**

**American & Hybrid/Backcross**

**GMNF Planting, Sunderland**

**American & Hybrid/Backcross**

Compared to native sugar maple  
and red oak beside Valley View planting

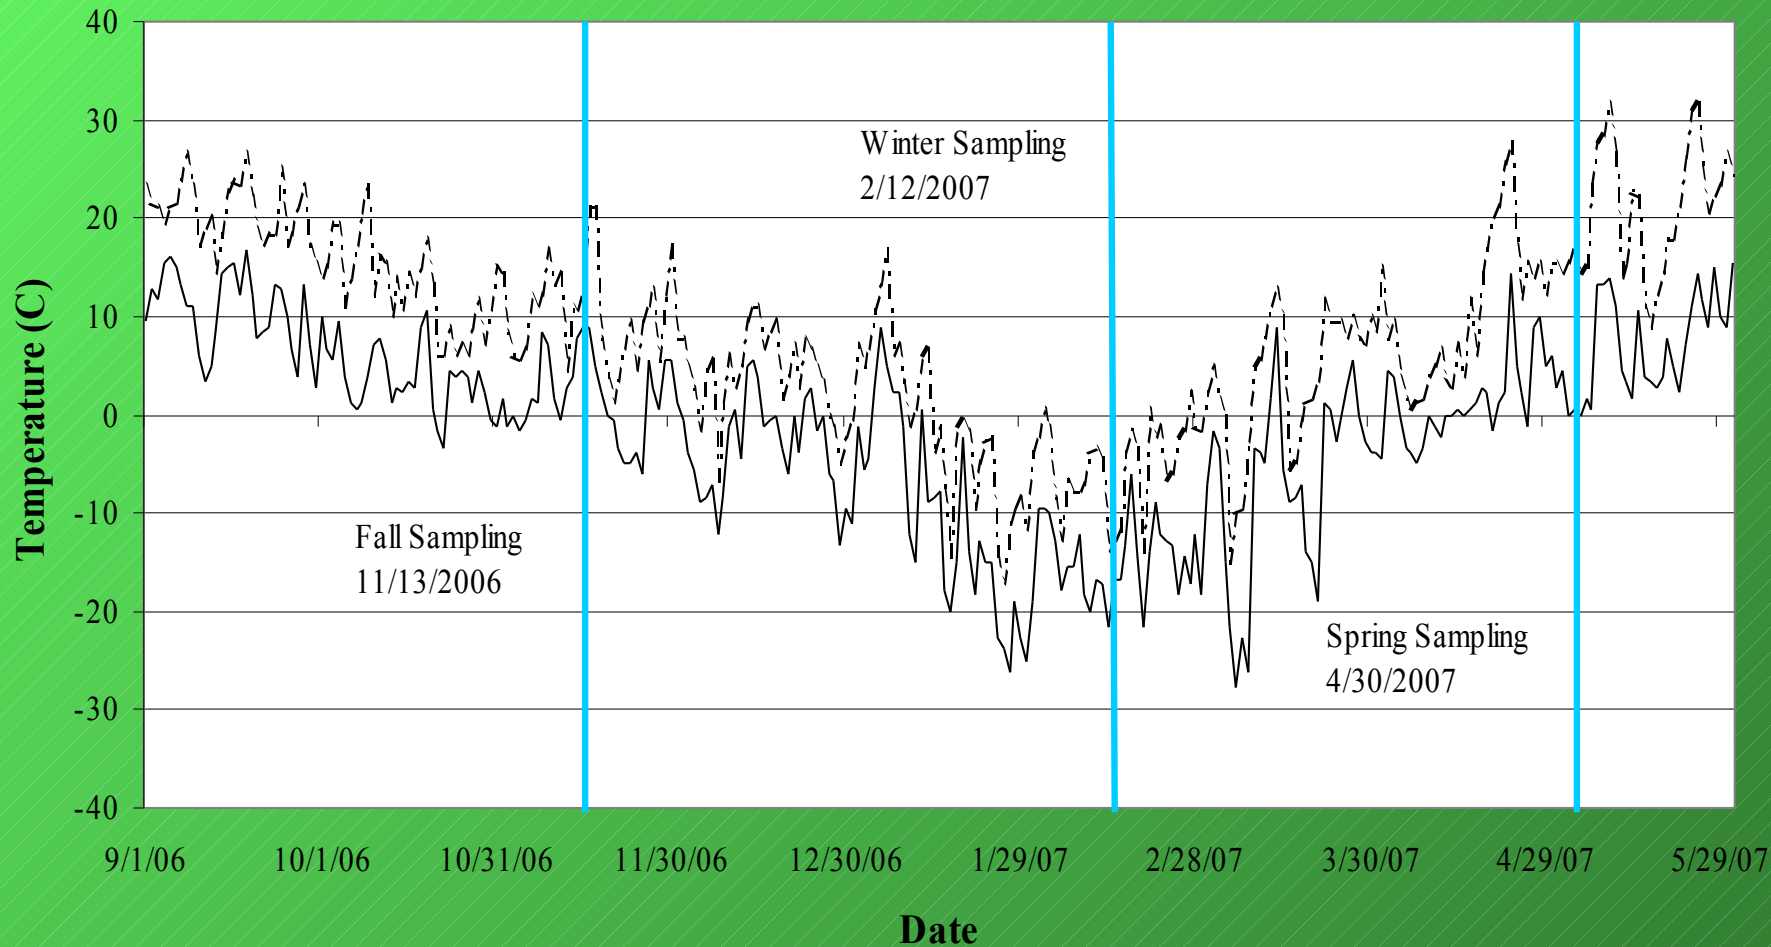

# Present: Cold Tolerance Tests

# Dialy Air Temperatures from Fall 2006 - Spring 2007

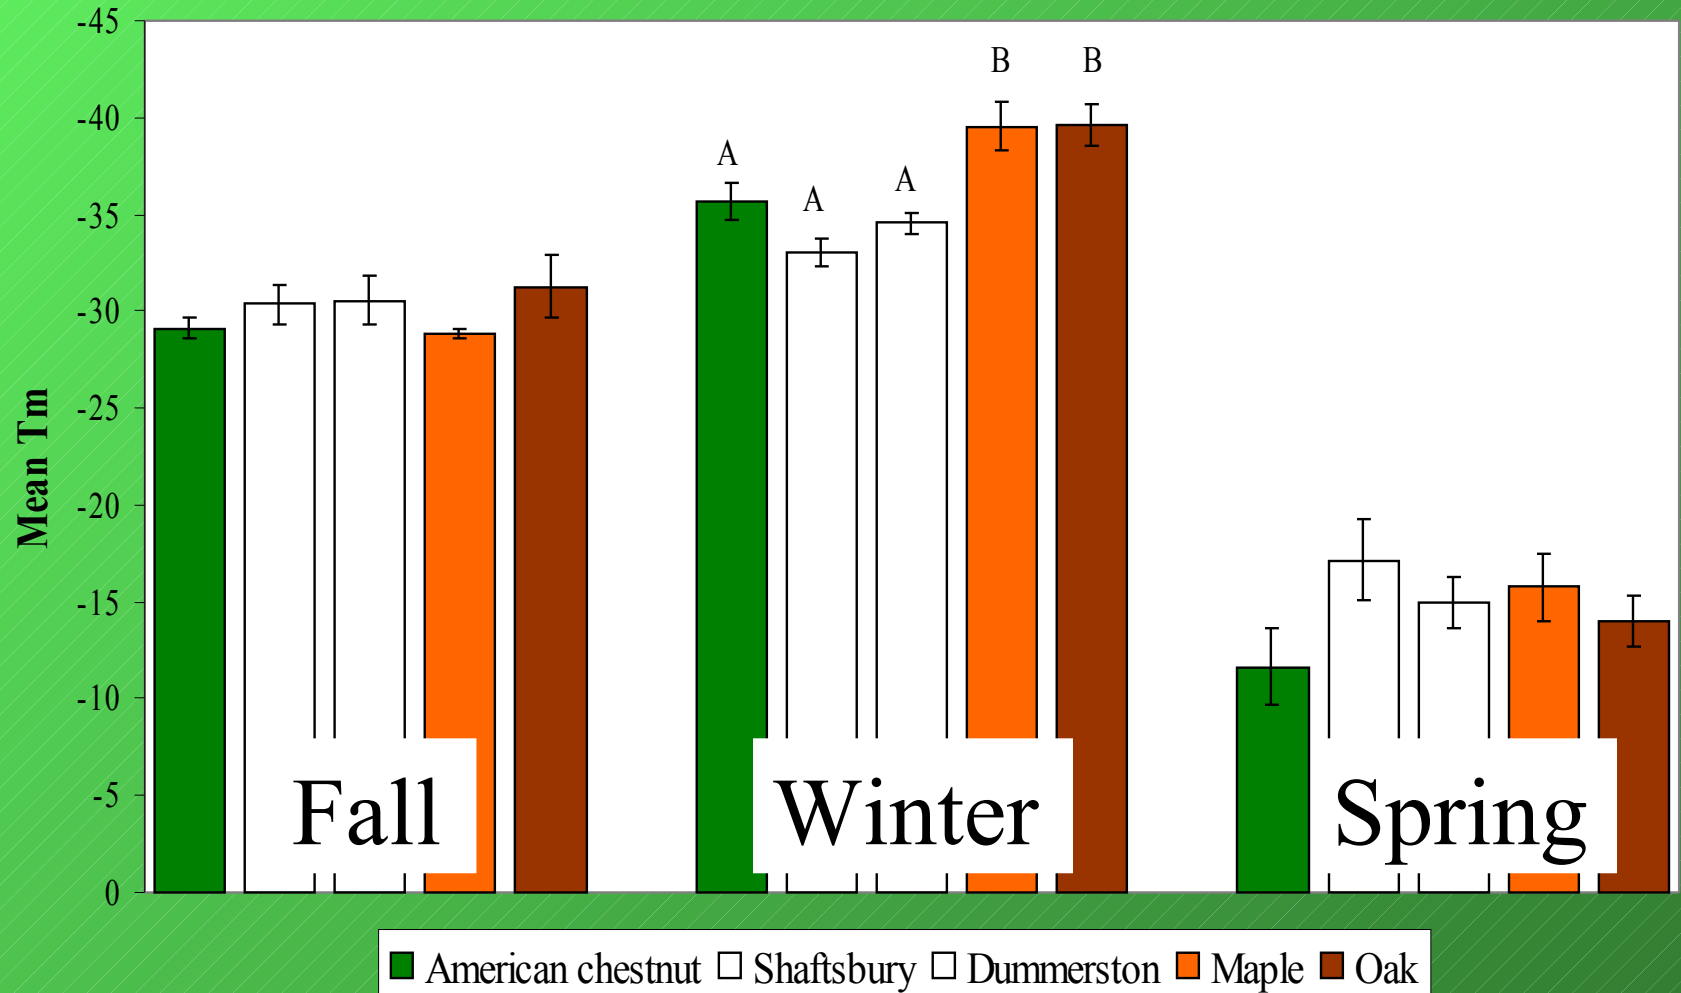

Temperature Data from NOAA National Climate Data Center, collected at Burlington International Airport

----- Maximum Temperature (C)    ——— Minimum Temperature (C)

# Mean Shoot Cold Tolerance (Tm) Measured in Shelburne, VT 2006-2007

Species/Seed Source

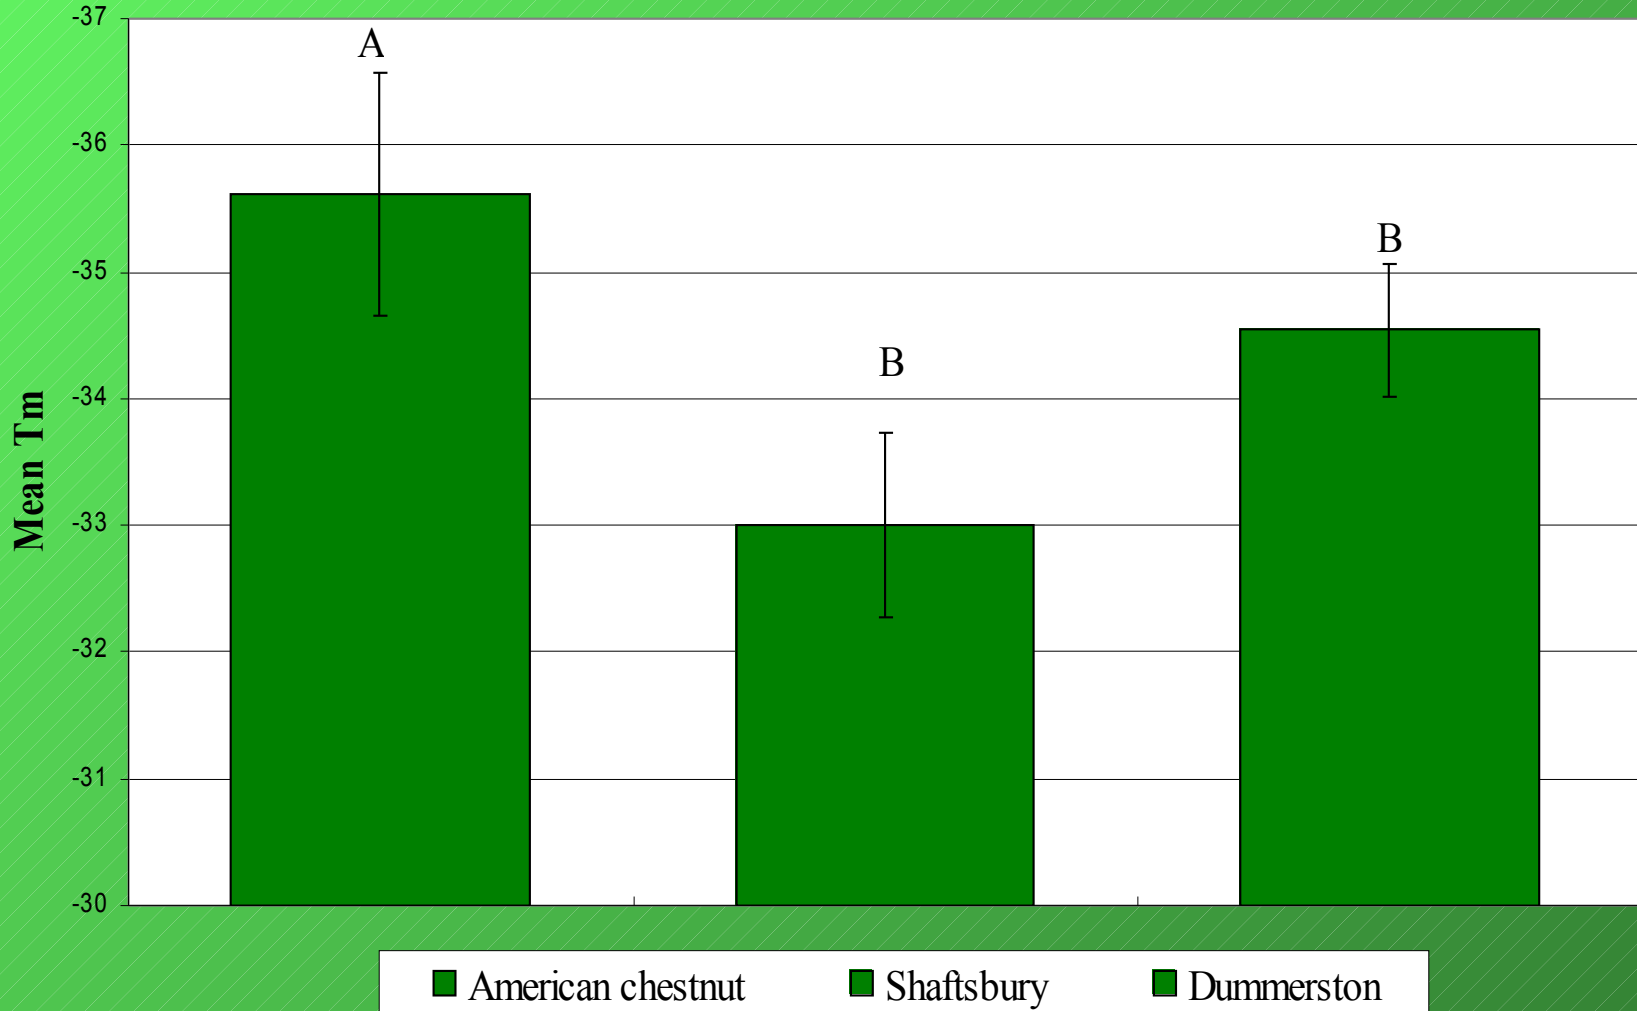

A and B are significantly different at  $p < 0.0001$

# Mean Winter Shoot Cold Tolerance ( $T_m$ ) for Three Chestnut Sources in Shelburne, VT 2006-2007

Seed Source

A and B are significantly different at  $P = 0.0745$

# Mean Terminal Shoot Winter Injury in Shelburne, VT by Species/Seed Source, 2006-2007

\* No damage observed on these sources near chestnut

# Present: Winter Injury Assessment

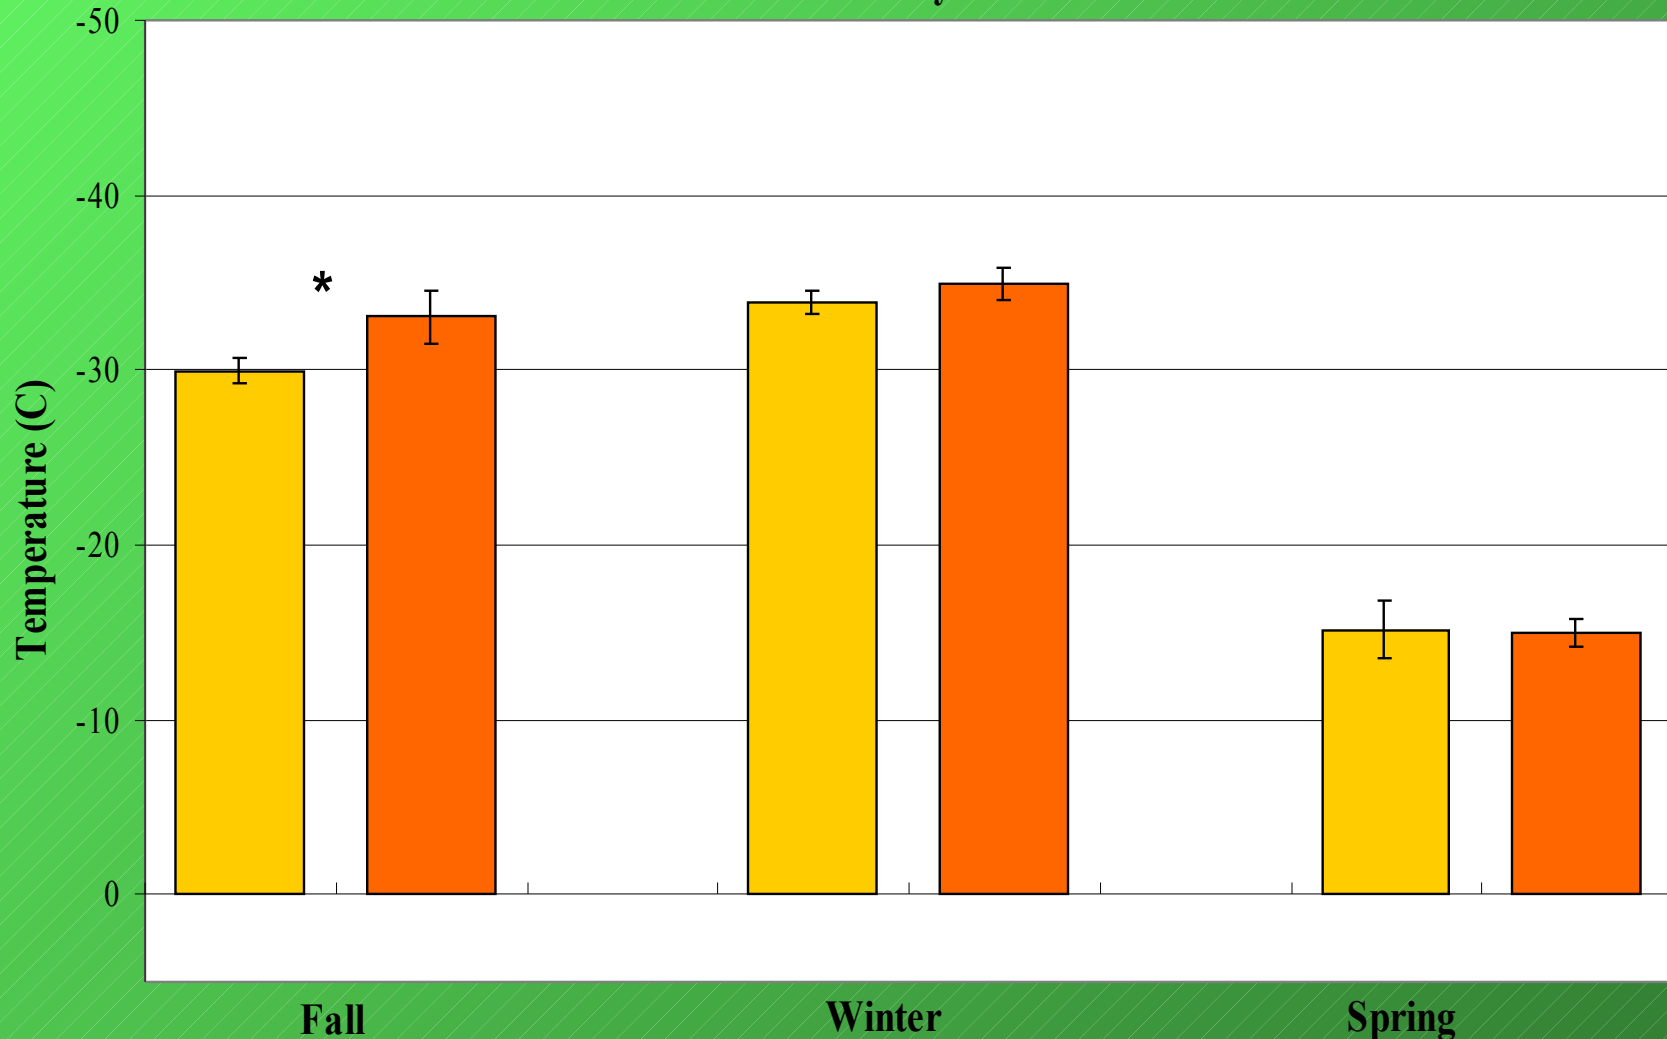

**Terminal shoot dieback**

**Shrub-like growth habit**

# Mean Shoot Cold Tolerance ( $T_m$ ) in Shelburne and Sunderland, VT 2006-2007

Site Location by Season

\* = significant difference in  $T_m$  at  $p \leq$

Shelburne Sunderland

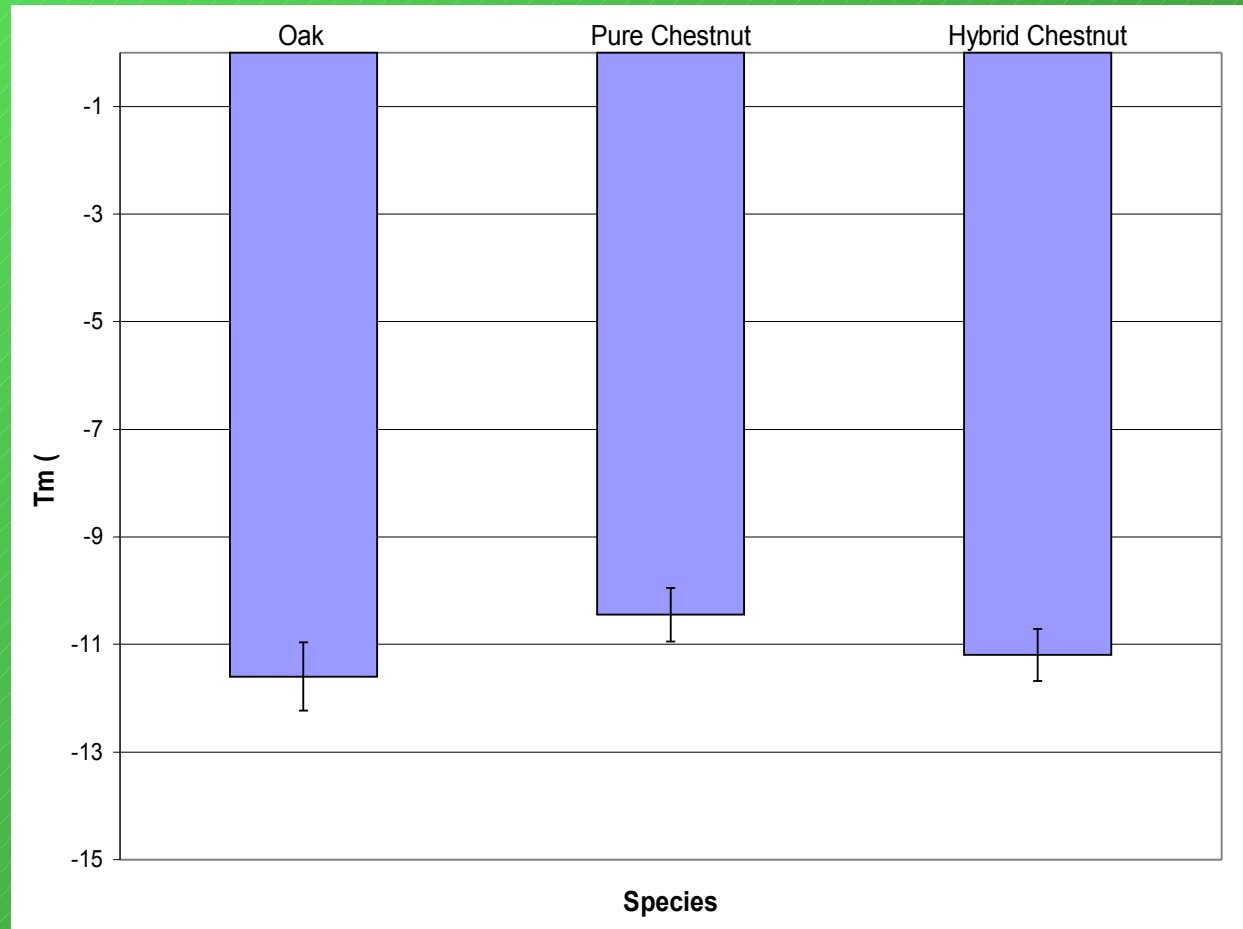

# Minimum Daily Temperatures Fall 2006

Temperature Data from NOAA National Climate Data Center, collected at Burlington International Airport in Burlington, VT and at W. H. Morse State Airport in Bennington, VT

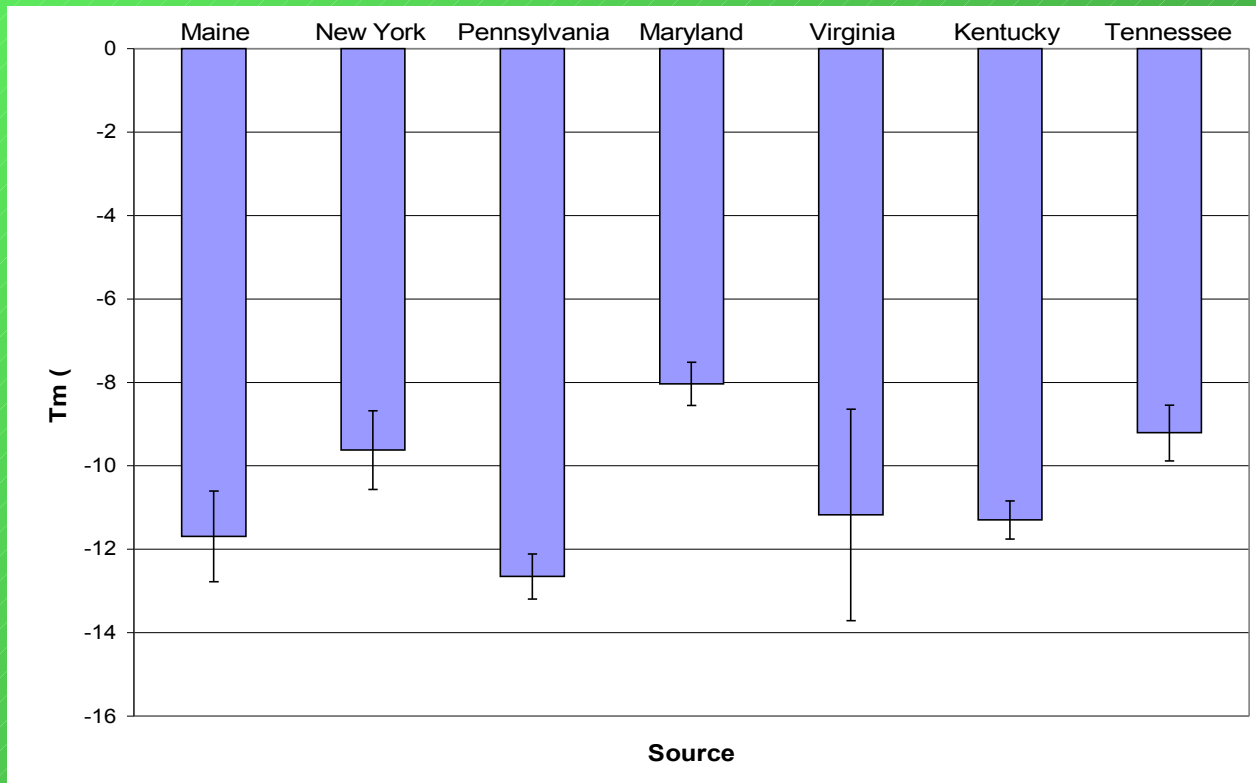

# Present: Seed Cold Tolerance

- Pure American, backcrossed, red oak
- No significant differences
- All intolerant to ambient air temperatures

# Present: Seed Cold Tolerance

- Different sources of American chestnut
- Significant differences among sources ( $P = 0.043$ )
- Potential for increased tolerance through breeding

# Future: Cold Tolerance Implications

- **Limited cold tolerance complicates restoration**
- **Augment seedling shoot cold tolerance**
  - Cultural practices - winter protection and fertilization options
  - Genetic selection for increased cold hardiness

# Future: Climate Change Implications

- Warmer climate predicted northeastern US:
  - Winter warming of 2-3 °C, with nighttime temperatures warming more than daytime
  - Future VT climate like Maryland – Georgia?
  - Decreased snow pack and days with snow on the ground

*Potential Consequences of Climate Variability and Change for the Northeastern United States*, National Assessment Synthesis Team, USGCRP 2004 and *Climate Change in the US Northeast*, NECIA 2006

# Future: Climate Change Implications

- Warming beneficial to seedling/seed winter survival?
- Species shift from beech-birch-maple to oak-hickory (and chestnut?)
- Decreased snow pack potentially problematic
  - Less insulation for shoots of snow-buried seedlings
  - More soil freezing and damage to buried seed

# Future: Climate Change Implications

- Wildlife benefits – annual mast
- Timber and biomass
- Carbon sequestration
  - Fast growth, large size/volume, rot resistance
